### CHAPTER 7 EVOLUTION

- 7.1 Origin of Life
- 7.2 Evolution of Life Forms - A Theory
- 7.3 What are the Evidence for Evolution?
- 7.4 What is Adaptive Radiation?
- 7.5 Biological Evolution
- 7.6 Mechanism of Evolution
- 7.7 Hardy-Weinberg Principle
- 7.8 A Brief Account of Evolution
- 7.9 Origin and Evolution of Man

Evolutionary Biology is the study of history of life forms on earth. What exactly is evolution? To understand the changes in flora and fauna that have occurred over millions of years on earth, we must have an understanding of the context of origin of life, i.e., evolution of earth, of stars and indeed of the universe itself. What follows is the longest of all the condensed and congested stories. This is the story of origin of life and evolution of life forms or biodiversity on planet earth in the context of evolution of earth and against the background of evolution of universe itself.

#### 7.1 Ours or Lays

When we look at stars on a clear night sky we are, in a way, looking back in time. Stellar distances are measured in light years. What we see today is an object whose emitted light started its journey millions of years back and from trillions of kilometres away and reaching our eyes now. However, when we see objects in our immediate surroundings we see them instantly and hence in the present time. Therefore, when we see stars we apparently are peering into the past.

The origin of life is considered a unique event in the history of universe. The universe is vast. Relatively speaking

### BIO TECHNOLOGY AND ITS APPLICATIONS

**SUMMARY**

Biotechnology has given to humans several useful products by using microbes, plant, animals and their metabolic machinery. Recombinant DNA technology has made it possible to engineer microbes, plants and animals such that they have novel capabilities. Genetically Modified Organisms have been created by using methods other than natural methods to transfer one or more genes from one organism to another, generally using techniques such as recombinant DNA technology.

GM plants have been useful in increasing crop yields, reduce post-harvest losses and make crops more tolerant of stresses. There are several GM crop plants with improved nutritional value of foods and reduced the reliance on chemical pesticides (pest-resistant crops).

Recombinant DNA technological processes have made immense impact in the area of healthcare by enabling mass production of safe and more effective therapeutics. Since the recombinant therapeutics are identical to human proteins, they do not induce unwanted immunological responses and are free from risk of infection as was observed in case of similar products isolated from non-human sources. Human insulin is made in bacteria yet its structure is absolutely identical to that of the natural molecule.

Transgenic animals are also used to understand how genes contribute to the development of a disease by serving as models for human diseases, such as cancer, cystic fibrosis, rheumatoid arthritis and Alzheimer's.

Gene therapy is the insertion of genes into an individual's cells and tissues to treat diseases especially hereditary diseases. It does so by replacing a defective mutant allele with a functional one or gene targeting which involves gene amplification. Viruses that attack their hosts and introduce their genetic material into the host cell as part of their replication cycle are used as vectors to transfer healthy genes or more recently portions of genes.

The current interest in the manipulation of microbes, plants, and animals has raised serious ethical questions.

### EXERCISES

- Crystals of Bt toxin produced by some bacteria do not kill the bacteria themselves because:
  - (a) bacteria are resistant to the toxin
  - (b) toxin is immature
  - (c) toxin is inactive
  - (d) bacteria encloses toxin in a special sac.
- What are transgenic bacteria? Illustrate using any one example.
- Compare and contrast the advantages and disadvantages of production of genetically modified crops.
